DETAILED ACTION

Response to Arguments

On page 15 of the remarks, Applicant notes that “**claim 1** has been amended to clarify that the specifying information memory includes a physical memory, which now requires more than software alone.” In view of this amendment, the examiner notes that the claim is now drawn only to statutory embodiments, and the rejection under 35 USC 101 has been withdrawn.

On page 15 of the remarks, Applicant notes that “**claim 25** is directed to an integrated circuit, which requires physical hardware and requires more than software alone.” Although the specification discloses “...the present invention may be embodied as computer programs realizing the methods by a computer, or digital signals representing the computer programs (see page 61, lines 7-10),” the examiner notes that the specification also discloses that the claimed integrated circuit is comprised of only statutory embodiments that require some sort of physical hardware (see, e.g., the entirety of page 62 as well as lines 1-19 of page 63). In view of these sections of the specification, the examiner believes the claim is now drawn to only statutory embodiments, and the rejection under 35 USC 101 has been withdrawn.

Allowable Subject Matter

Claims 1, 3, 8 and 16-27 are allowed.

Applicant's **claim 1** is drawn toward a video processing apparatus for specifying frames of content to be start frames of a plurality of viewing segments of the content, when segmenting the content into the plurality of viewing segments, the video processing apparatus comprising: a specifying information memory, which is a physical memory storing a plurality of pieces of specifying information, each piece of specifying information of the plurality of pieces of specifying information (i) corresponding to a different type of content, and (ii) including: a first condition identifying a feature of frames of the content to be detected as candidates for presentation frames, each of the presentation frames for being displayed as a representative still image of a respective viewing segment of the plurality of viewing segments; an exclusion condition identifying a feature of frames of the content to be excluded from being the candidates for the presentation frames; a second condition identifying a feature of frames of the content to be detected as candidates for start frames; and a selection condition identifying a relationship between a presentation frame of the content and a frame of the content that is to be selected as a start frame; a content obtaining unit operable to obtain a content; an information obtaining unit operable to obtain type information identifying the type of the obtained content; an extracting unit operable to extract, from the specifying information memory, a piece of specifying information, of the plurality of pieces of specifying information, that corresponds to the type of the content identified by the obtained type information; and a specifying unit operable, in accordance with the extracted piece of specifying information, to (i) specify the presentation frames of the content by detecting, from all frames of the content, frames of the content satisfying the

first condition and by subsequently excluding, from the detected frames satisfying the first condition, frames satisfying the exclusion condition, and (ii) specify start frames of the content by detecting, from all frames of the content, frames of the content satisfying the second condition and by subsequently selecting, from the detected frames satisfying the second condition, frames satisfying the relationship identified by the selection condition with respect to the specified presentation frames wherein specifying unit includes: a plurality of detecting subunits, each detecting subunit of the plurality of detecting subunits being operable to detect frames of the content having a different feature; an excluding subunit operable to exclude, from the detected frames satisfying the first condition, frames satisfying the exclusion condition; and a selecting subunit operable to select, from the detected frames satisfying the second condition, frames satisfying the relationship identified by the selection condition, wherein each of the first condition, the exclusion condition, and the second condition is an identifier to be used by one detecting subunit of the plurality of detecting subunits, and wherein, when operating in accordance with the extracted piece of specifying information corresponding to the type of the content identified by the obtained type information, the specifying unit (i) detects, from all frames of the content, a plurality of large-caption start frames, each large-caption start frame, of the plurality of large-caption start frames, being a first frame of a series of frames of the content during which a caption of a size larger than a threshold continuously appears in a predetermined region, and (ii) specifies, as a presentation frame of the content, each large-caption start frame, of the plurality of large-caption start frames, remaining after removing, from the plurality of

large-caption start frames, small-caption flames having a caption of a size smaller than a threshold appearing in a region other than the predetermined region.

Applicant's independent **claim 1** comprises a particular combination that is neither taught nor fairly suggested by the prior art. The closest prior art of record, Nakamura (US Patent 7,424,204), differs from the claimed invention by failing to teach or fairly suggest wherein, when operating in accordance with the extracted piece of specifying information corresponding to the type of the content identified by the obtained type information, the specifying unit (i) detects, from all frames of the content, a plurality of large-caption start frames, each large-caption start frame, of the plurality of large-caption start frames, being a first flame of a series of frames of the content during which a caption of a size larger than a threshold continuously appears in a predetermined region, and (ii) specifies, as a presentation flame of the content, each large-caption start flame, of the plurality of large-caption start flames, remaining after removing, from the plurality of large-caption start frames, small-caption flames having a caption of a size smaller than a threshold appearing in a region other than the predetermined region.

Regarding independent **claims 25, 26 and 27**, the examiner notes that the claims are merely the corresponding integrated circuit, method, and computer-readable medium, respectively, of the apparatus of claim 1, and are therefore found allowable in view of the explanation set forth in claim 1 above.
